HIRING · SDE INTERN

INDIA'S FIRST TECH STUDIO ENGINEERED TO STAY FLAT · BANJARA HILLS, HYDERABAD

Build a system that calls me.

THE ASSIGNMENT

I am a potential customer looking to build an e-commerce website. Build an AI voice system that **calls me on 8688664337**, speaks to me in Telugu, Hindi or English, sells me the service, works out how serious a buyer I am, and takes the next action while we are still on the call. Then sends me a WhatsApp with the context of what we discussed, your resume and your number.

WHAT IT MUST DO

01 Calls me on 8688664337, on its own
02 Speaks Telugu, Hindi or English
03 Sells e-commerce website development
04 Asks budget, products, timeline, features
05 Understands my answers
06 Classifies me Hot, Warm or Cold
07 Fires a WhatsApp mid call on high intent
08 Books the callback when I name a time
09 Follows up using what I actually said
10 Sends your resume, number and build image

THE OUTCOME

If your system calls me and it works, I call you back. That is the entire selection process.

THE ROLE	STIPEND	YOUR API SPEND	DEADLINE
SDE Intern, Banjara Hills	**Rs 30,000 a month**	**Reimbursed when you join**	**Rolling, no cut off**

SEND THE WORKING PROTOTYPE, YOUR RESUME AND YOUR NUMBER TO

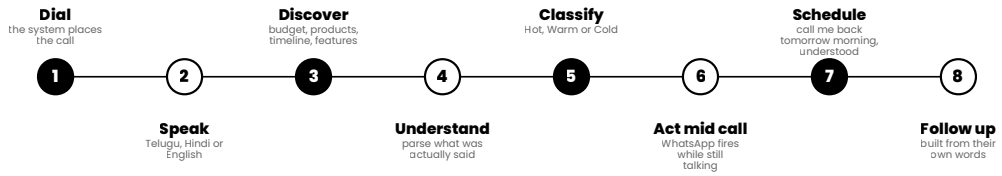

8688664337

Do not send a deck explaining how you would build it. Build it. Call me. The rest of this document is the detail.

01

The assignment in detail

Imagine I am a potential customer looking to build an e-commerce website. Build a system that calls me on **8688664337**, sells me that service, works out how serious I am, and acts on it while we are still talking.

The eight things your system has to do, in the order it has to do them.

What we are actually testing. Not your slide deck, not your architecture opinion, and not how many APIs you can name. We want to know whether you can take an unclear problem, choose a stack, wire live services together, handle the real world when it talks back, and ship something that works on the first call. That is the job.

02

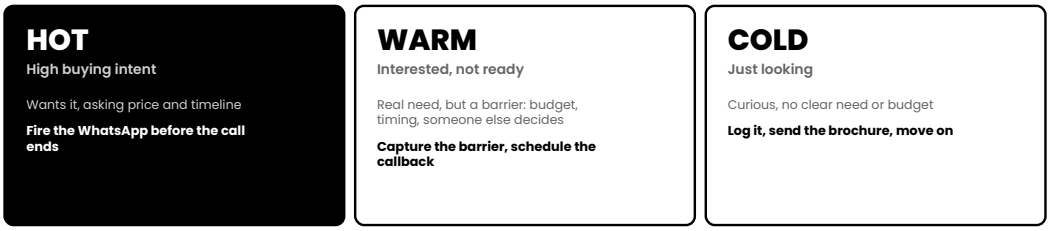

What your system must do

#	REQUIREMENT	WHAT WE WILL CHECK ON THE CALL
1	**Place the call**	Your system dials 8688664337 by itself. No manual dialling, no you on the line.
2	**Speak the language**	Telugu, Hindi or English. Handle whichever one I answer in, and stay in it.
3	**Sell the service**	Pitch e-commerce website development like a person would, not like a recorded message.
4	**Ask the right questions**	Budget, what I sell, how many products, timeline, features I need. Ask them naturally, not as a form.
5	**Understand the answers**	Parse what I actually said, including when I am vague, and classify me as Hot, Warm or Cold.
6	**Act during the call**	If I show high buying intent, a WhatsApp message reaches me before the call ends. Mid call, not after.
7	**Schedule from speech**	If I say call me back tomorrow morning, your system understands it and books the callback itself.
8	**Follow up smartly**	The follow up references what I actually said, not a template with my name pasted in.
9	**Send yourself, with context**	After the call, a WhatsApp message carrying the full context of what we actually discussed, your resume, your mobile number, and an image showing how you built it. Detail in Section 06.
10	**Work**	If it works, I call you back. That is the whole selection process.

03

Reading the lead correctly

Most systems fail here. They transcribe well and then treat every caller the same. The classification is what decides the action, so get this part right.

Three states, three different actions. The action is the point, not the label.

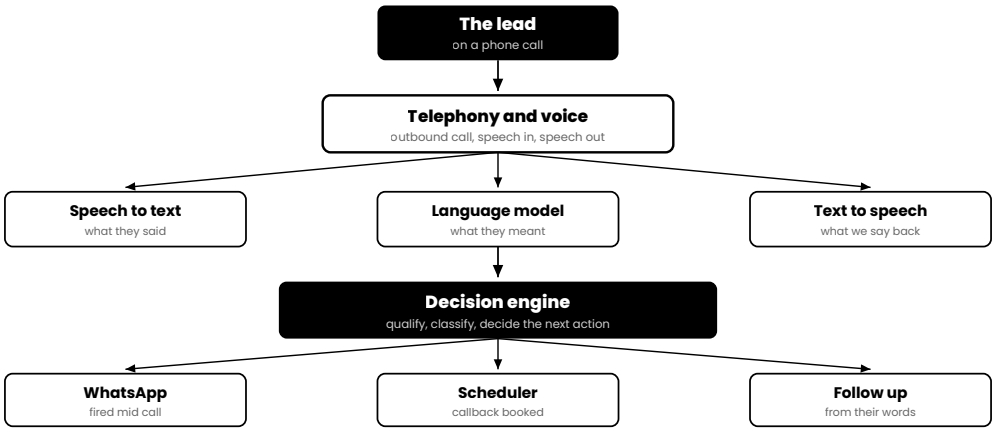

> **Where we will push you.** Real people do not say I am a hot lead. They say things like send me the details, my budget is not much right now, my brother handles this, or how soon can you start. Your system is being judged on how it reads that, and on what it does next.

04

One way to build it

This is a reference, not a requirement. Use WAPI, OmniDimension, ElevenLabs, Twilio, Vapi, Retell, Soniox, a self hosted model, or anything else you like. We do not care about the stack. We care that it works.

> **If you want a starting point, here is what we would reach for.** These are suggestions, not instructions. Nothing here is mandatory and using something else costs you no marks.
>
> - **Voice generation, OmniDimension.** Any voice works, though a female voice tends to land better on outbound calls in this market. Add a little background noise. A voice that sounds like it is calling from a room, not from a studio, gets hung up on far less often.
> - **Speech to text, Soniox.** Good for live transcription during the call, which is what you need if the WhatsApp has to fire before the call ends.
> - **Everything else is yours.** Telephony, the language model, the scheduler, the WhatsApp layer, hosting. Pick what you can ship fastest.

A workable shape: voice in, understanding in the middle, and actions firing out while the call is still live.

The hard parts, in our experience

- Latency. If the reply takes three seconds, the conversation is dead.
- Interruption. People talk over the bot. Handle it.
- Code switching. Telugu and English in the same sentence is normal here.
- Firing an action mid call without blocking the conversation.
- Turning call me back tomorrow morning into an actual scheduled time.

What will impress us

- It works on the first attempt, live, without you babysitting it
- The conversation sounds like a person, not a menu
- The WhatsApp arrives while we are still talking
- The follow up quotes something specific I said

- You can explain every decision you made and what you would fix next

05

How we score it

For transparency, this is the actual scorecard we use. Nothing hidden.

WHAT WE ASSESS	WHAT FULL MARKS LOOKS LIKE	POINTS
It calls and holds a conversation	Dials on its own, speaks naturally, survives a real two way conversation	**25**
Language handling	Works in Telugu, Hindi or English, including mixed sentences	**10**
Discovery quality	Asks the questions that actually qualify a buyer, in a natural order	**10**
Intent classification	Reads Hot, Warm or Cold correctly from indirect answers	**15**
Mid call action	WhatsApp fires during the call, triggered by intent, not by call end	**15**
Callback scheduling	Turns spoken time into a booked callback, correctly, including vague phrasing	**10**
Follow up and WhatsApp quality	References real content from the conversation, and carries the four things listed in Section 06	**10**
Engineering judgement	Sensible architecture, handles failure, you can defend your choices	**5**
Total		**100**

Anything at 60 or above gets a call back from us. Below that we will still tell you where it broke, because you will have learned something either way.

06

What to send

The WhatsApp message your system sends me

This is part of the assignment, not an afterthought. When the call ends, the message that reaches me must contain all four of these.

#	MUST CONTAIN	WHAT GOOD LOOKS LIKE
1	**The context of our call**	What I said I wanted, the budget I mentioned, the timeline, the features I asked about. Specifics from the conversation, not a summary that could apply to anyone.
2	**Proper framing of that context**	Written as a person would write it after a real call. It should read like a follow up, not like a log file pasted into WhatsApp.
3	**Your mobile number**	Clearly visible, so I can call you back without hunting for it.
4	**An image of how you built it**	One image showing your architecture and flow. Hand drawn on paper is fine. We want to see how you think, not how well you use a diagram tool.

Your resume goes with it. If your system can attach the resume automatically, better.

Send to 8688664337

- The working prototype, live, that can call the number on demand
- A one page architecture diagram of what you built, as an image or PDF, showing the flow from call to action
- A short note, under 200 words, on what works, what does not, and what you would build next

- Your resume
- Your mobile number
- A repository link if you have one

Do not send

- A presentation explaining how you would build it
- A plan, a proposal, or an estimate
- A demo video instead of a working system
- Anything that needs us to install something to see it work

On money. Spend what you need on APIs, voice minutes, WhatsApp, hosting and tools. Keep the receipts. If you make it through and join us, we reimburse what you spent building and testing this. Cost is not the filter here.

The role, if you make it through

SDE Intern at Banjara Hills, Hyderabad, on a stipend of **Rs 30,000 a month**. You work on the production version of exactly this: the AI voice and WhatsApp system that runs real lead pipelines for real businesses.

Timing

Rolling. There is no queue and no cut off date. The moment your system calls and works, you are through to the next round. We would rather see a working call this week than a perfect one next month.

> **One honest warning.** This assignment is deliberately harder than a normal internship task, because we are hiring on evidence rather than on a resume. Plenty of people will not finish it. If you get partway and the call connects but the classification is weak, send it anyway with your note on what you would fix. We would rather see honest partial work with clear thinking than nothing at all.

Build something cool. Call me.
